# Misalignment

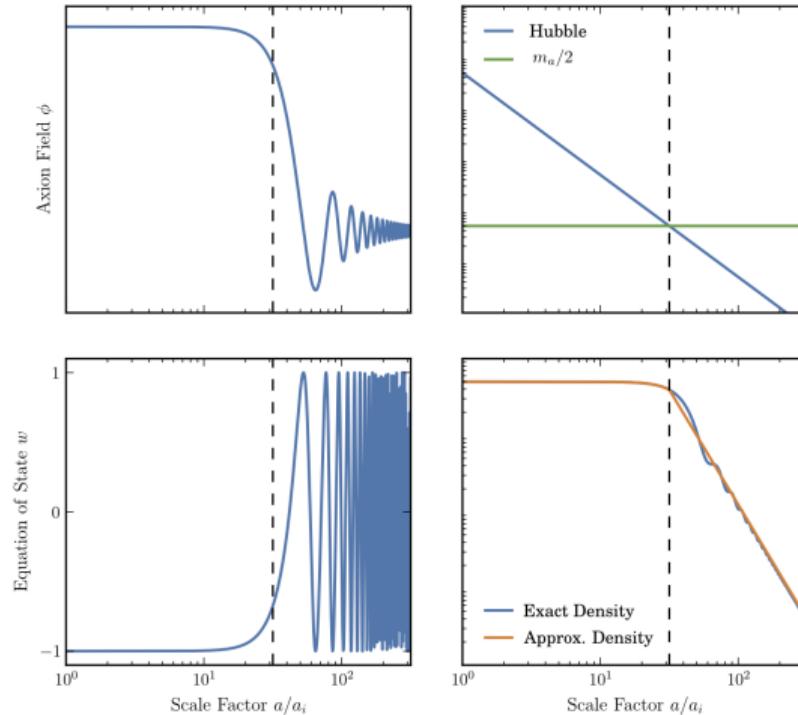

$a\Lambda$ CDM

Yu-Cheng QIU

Introduction

$a\Lambda$ CDM

Summary and Discussion

For a light (pseudo)scalar  $\phi$ :

- When  $H \gg m_\phi$ ,  
 $\phi = \phi_i$ ,  $\rho_\phi = \text{const.}$
- When  $H \ll m_\phi$ ,  
 $\phi \simeq e^{-Ht} \cos(m_\phi t)$   
 $\langle \rho_\phi \rangle \propto a^{-3}$

Figure: From Marsh (2016)

# Axion (ALP) Explanation

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDM

Summary and Discussion

$$\mathcal{L} \supset c_\gamma \frac{\alpha}{4\pi} \frac{\phi}{f_\phi} F_{\mu\nu} \tilde{F}^{\mu\nu} \quad [\text{Carroll, Field (1991)}]$$

$$\implies \beta \simeq 0.067^\circ \times c_\gamma \frac{\Delta\phi}{f_\phi}$$

- Fuzzy dark matter axion,  $m \sim 10^{-22}$  eV is too heavy to explain the  $\beta$ .
- axi-Higgs axion ( $m \sim 10^{-29}$  eV) is just suitable.  
[Fung, Li, Liu, Luu, **Qiu**, Tye (2021)]
- For quintessence axion  $m \sim H_0$ ,  $\Delta\phi/f_\phi$  is small. So  $c_\gamma$  should be large.  
[Lin, Yanagida (2022)]

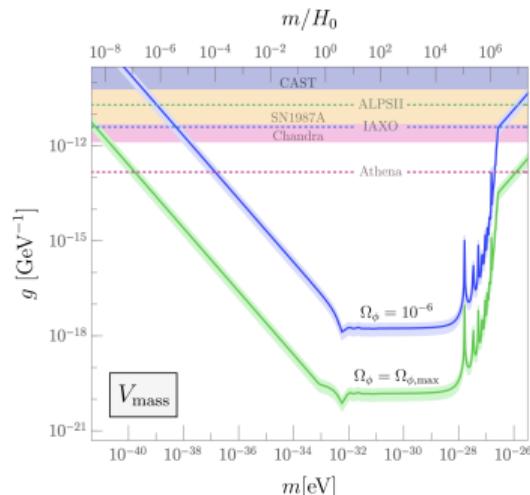

Figure: Fujita et al. 2011.11894

# Can SMEFT explain $\beta$ ?

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDMSummary and  
Discussion

$$\mathcal{L}_{\text{CS}} = \frac{\alpha}{8\pi} \sum_a \frac{\tilde{\mathcal{O}}_a}{\Lambda_a^n} F_{\mu\nu} \tilde{F}^{\mu\nu}, \quad n = \dim[\tilde{\mathcal{O}}_a]$$

Building Blocks:

$$H(\text{dim 1}), \quad D_\mu(\text{dim 1}), \quad \psi(\text{dim 3/2}), \quad X_{\mu\nu}(\text{dim 2})$$

- $n = 2$ :  $H^\dagger H$
- $n = 3$ : (LEFT)  $\mathcal{C}^{ij} \bar{e}^i P_L e^j + \text{h.c.}$ , ( $e \rightarrow \nu, d, u$ ).
- $n = 4$ :  $\sum_{X=F,Z,W,G} X_{\alpha\beta} X^{\alpha\beta} + X_{\alpha\beta} \tilde{X}^{\alpha\beta}$

No. All SM particles does not explain the observed  $\beta$   
[Nakai, Namba, obata, **Qiu**, Saito (2023)]

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDM

Summary and  
Discussion

## II. a(xion) $\Lambda$ CDM

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDMSummary and  
Discussion

$$\ddot{\phi} + 3H(t)\dot{\phi} + V'(\phi) = 0, \quad V(\phi) = m^2 f_\phi^2 (1 - \cos \phi/f_\phi)$$

$$\frac{H^2}{H_0^2} = \frac{\Omega_m}{a^3} + \Omega_\Lambda + \frac{\rho_\phi(a)}{\rho_{\text{crit},0}}, \quad \rho_\phi = \frac{1}{2}\dot{\phi}^2 + V(\phi)$$

The dark energy is composed of  $\Lambda$  and  $\rho_\phi$ . So the EoS

$$w_{\text{DE}} = \frac{\dot{\phi}^2/2 - V(\phi) - \Lambda}{\dot{\phi}^2/2 + V(\phi) + \Lambda} = -1 + \frac{\dot{\phi}^2}{\dot{\phi}^2/2 + V(\phi) + \Lambda}$$

We propose the rolling of  $\phi$  explains the  $\beta$  and  $w_{\text{DE}} \neq -1$ .

# $a\Lambda$ CDM

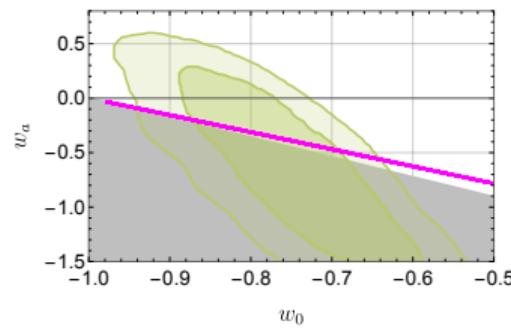

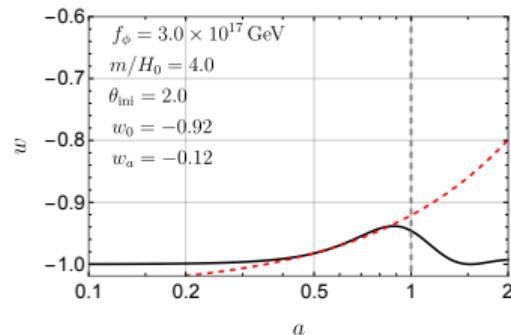

$a\Lambda$ CDM

Yu-Cheng QIU

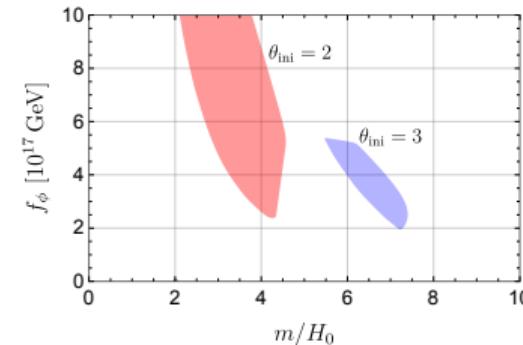

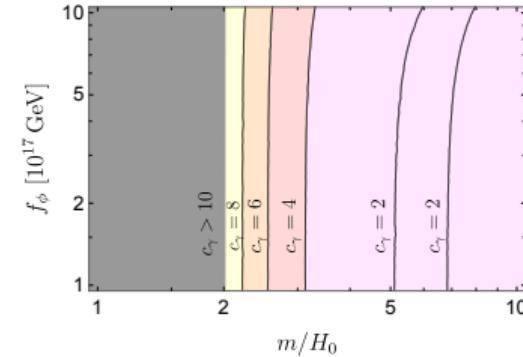

Introduction

$a\Lambda$ CDM

Summary and Discussion

The contour region is best fit values from data set:  
 BAO + SN + BBN +  $\theta_\star$  +  $t_U$ .

We take appropriate  $\Omega_\Lambda \in (0.3, 0.7)$  which gives correct relic.  
 $\theta = \phi/f_\phi$

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDMSummary and  
Discussion

To explain the  $\beta \sim 0.3^\circ$  and  $w_{\text{DE}} \neq -1$ , we have

- axion mass:

$$2H_0 \lesssim m \lesssim 6H_0 ,$$

- consistent with string motivated axion  $f_\phi \sim \mathcal{O}(10^{17}) \text{ GeV}$ ,
- small  $c_\gamma \sim \mathcal{O}(1)$ ,
- and dS vacuum  $\Lambda > 0$ .

# $\Lambda < 0?$

$a\Lambda\text{CDM}$

Yu-Cheng QIU

Introduction

$a\Lambda\text{CDM}$

Summary and Discussion

In supergravity, the supersymmetric vacuum is AdS.  
AdS vacua are ubiquitous in String landscape.

If we forget about Cosmic Birefringence,  $\Lambda < 0$  is allowed.

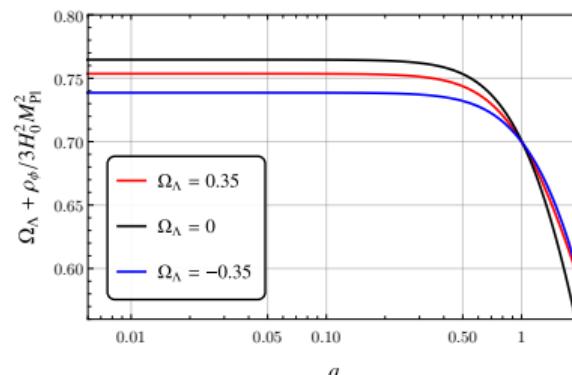

Figure: For  $m = 2 \times 10^{-33}$  eV

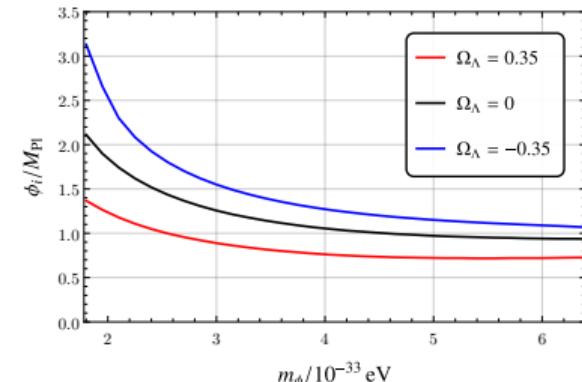

Figure: Parameter space that recreating the correct relic.

# $\Lambda < 0?$

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDM

Summary and  
Discussion

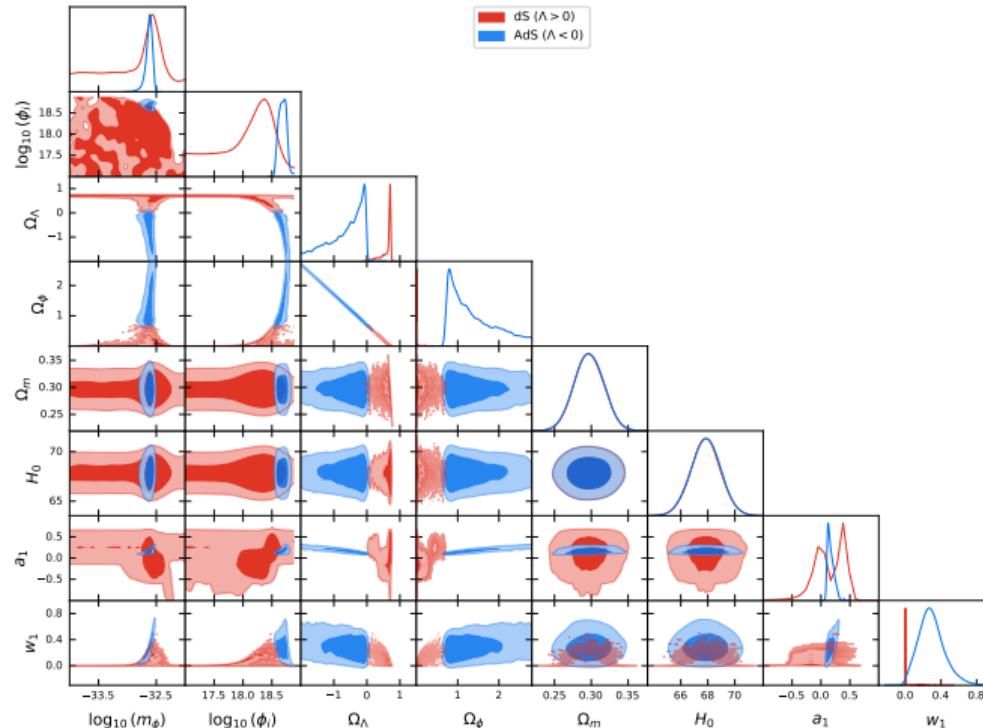

Figure: The units of  $m_\phi, \phi_i$  and  $H_0$  are implicitly assumed as eV, GeV and km/s/Mpc<sub>17/20</sub>

# New fitting formula

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDM

Summary and Discussion

$$w(a) = \begin{cases} -1 + w_1(a - a_1)^2 & 1 > a \geq a_1 \\ -1 & a < a_1 \end{cases}$$

Taking

$$m \simeq 2.8 \times 10^{-33} \text{ eV}$$

$$\phi_i \simeq 5.8 \times 10^{18} \text{ GeV}$$

$$\Omega_\Lambda \simeq -2.2$$

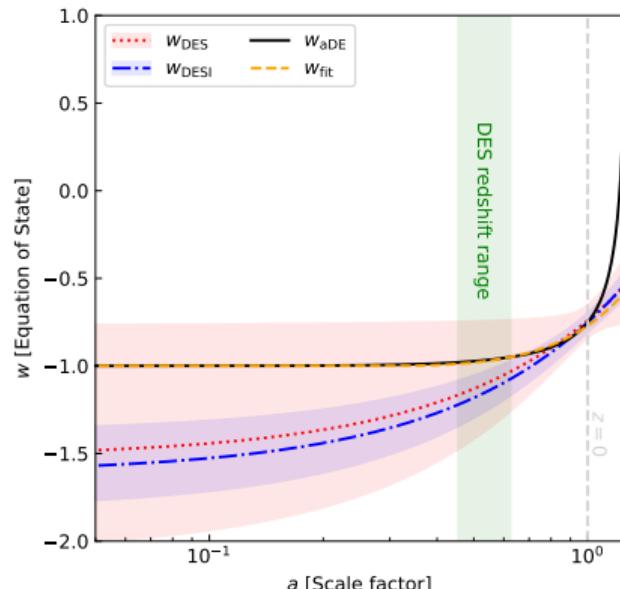

$$\Omega_m \simeq 0.3$$

$$H_0 \simeq 67.9 \text{ km/s/Mpc.}$$

Best fit:

$$w_1 \simeq 0.458$$

$$a_1 \simeq 0.292$$

# Summary

a $\Lambda$ CDM

Yu-Cheng QIU

Introduction

a $\Lambda$ CDM

Summary and  
Discussion

1. We propose a simple extension to  $\Lambda$ CDM to explain cosmic birefringence and dynamical dark energy.
2. The axion mass is pinned down to  $2H_0 \lesssim m \lesssim 6H_0$ , with  $f_\phi \sim \mathcal{O}(10^{17})$  GeV and small  $c_\gamma$ .
3. Neglecting the cosmic birefringence, the data allow AdS vacuum.
4. New fitting formula for the dynamical dark energy is proposed, pending for future analysis.

aΛCDM

Yu-Cheng QIU

Introduction

aΛCDM

Summary and  
Discussion

# Thank you

# Equation of motion

aΛCDM

Yu-Cheng QIU

The equation of motion expressed in scale factor  $a$  is

$$\theta'' + \left( \frac{4}{a} + \frac{H'}{H} \right) \theta' + \frac{m^2}{a^2 H^2} \sin \theta = 0. \quad (1)$$

Two Friedmann equations are

$$\frac{H^2}{H_0^2} = \frac{\Omega_m}{a^3} + \Omega_\Lambda + \frac{1}{6} \frac{H^2}{H_0^2} \frac{f_\phi^2}{M_{\text{Pl}}^2} \theta'^2 + \frac{V(\theta)}{3H_0^2 M_{\text{Pl}}^2} \quad (2)$$

$$a \frac{HH'}{H_0^2} = -\frac{3}{2} \frac{\Omega_m}{a^3} - \frac{1}{4} \frac{f_\phi^2}{M_{\text{Pl}}^2} \frac{a^2 H^2 \theta'^2}{H_0^2}. \quad (3)$$

Combining the above two gives

$$\frac{H'}{H} = -\frac{3}{2} \frac{\Omega_m}{a^4} \frac{H_0^2}{H^2} - \frac{1}{4} a \frac{f_\phi^2}{M_{\text{Pl}}^2} \theta'^2 \quad (4)$$

$$\frac{H^2}{H_0^2} = \left( \frac{\Omega_m}{a^3} + \Omega_\Lambda + \frac{V(\theta)}{3H_0^2 M_{\text{Pl}}^2} \right) \left( 1 - \frac{1}{6} \frac{f_\phi^2}{M_{\text{Pl}}^2} \theta'^2 \right)^{-1} \quad (5)$$
